

Character (mathematics)

In mathematics, a **character** is (most commonly) a special kind of function from a group to a field (such as the complex numbers). There are at least two distinct, but overlapping meanings^[1] Other uses of the word "character" are almost always qualified.

Multiplicative character

A **multiplicative character** (or **linear character**, or simply **character**) on a group *G* is a group homomorphism from *G* to the multiplicative group of a field (Artin 1966), usually the field of complex numbers. If *G* is any group, then the set Ch(*G*) of these morphisms forms an abelian group under pointwise multiplication.

This group is referred to as the character group of *G*. Sometimes only *unitary* characters are considered (thus the image is in the unit circle); other such homomorphisms are then called *quasi-characters* Dirichlet characters can be seen as a special case of this definition.

Multiplicative characters are linearly independent, i.e. if $\chi_1, \chi_2, \dots, \chi_n$ are different characters on a group *G* then from $a_1\chi_1 + a_2\chi_2 + \dots + a_n\chi_n = 0$ it follows that $a_1 = a_2 = \dots = a_n = 0$.

Character of a representation

The **character of a representation** φ of a group *G* on a finite-dimensional vector space *V* over a field *F* is the trace of the representation φ (Serre 1977). In general, the trace is not a group homomorphism, nor does the set of traces form a group. The characters of one-dimensional representations are identical to one-dimensional representations, so the above notion of multiplicative character can be seen as a special case of higher-dimensional characters. The study of representations using characters is called "character theory" and one dimensional characters are also called "linear characters" within this context.
